

USER MANUAL

Product QR Code and Barcode Generator

Product codes, QR labels and in-store selling for a WooCommerce shop

VERSION	DATE
1.0.1	28 September 2026

The screenshots in this manual show a sample shop ("Sample Shop") with sample products, staff and sales. They contain no real shop data. Names, prices and numbers on your screens will differ.

How to use this manual

This manual explains the Product QR Code and Barcode Generator plugin in plain language, with examples. It replaces the earlier owner guide. The PDF version (`user-manual.pdf`) opens from the **Plugin guide** button on the plugin's Dashboard and from the **User manual** link on the Plugins screen.

Who reads what:

- **The shop owner (administrator):** everything. Sections marked **Administrator only** are about screens only administrators can see or use.
- **Shop managers:** chapters 1 and 3 to 11 and 14. The administrator-only parts are marked, so you can skip them.
- **Sellers:** chapter 6 (Selling on the phone). The one-page seller guide (`seller-guide.pdf` , linked from the Dashboard and from My sales) has the same steps with pictures.

Every screenshot shows a sample shop called "Sample Shop" with sample products (kurtas, dupattas, sarees...), sample staff (Owner, Ravi, Asha, Vikram) and sample sales. The amounts are in Indian rupees (₹). Your own screens show your shop, your products and your numbers.

Words used in this manual:

- **Item:** something you sell as one unit: a simple product, or one variation of a variable product (for example the size M of a kurta).
- **Code:** the item's permanent product code, for example `DC-7K4M-9P2X-Q8RT` . It is printed on the label as a QR code.
- **Label:** the sticker with the QR code that you put on the item.
- **Scan page:** the page a phone opens when it scans a label.

1. What the plugin does

Every product and every variation (for example each size or colour) gets its own permanent code. You print the code as a QR label and stick it on the item. In the shop, a seller scans the label with their phone, sees the product, the price and the stock, and marks it as sold. The stock goes down straight away: the same stock your online shop uses.

Example. A customer buys a cotton kurta in size M. Asha, a seller, scans the kurta's label with a phone, chooses quantity 1 and "Cash", and presses **Confirm sale**. The kurta's stock goes from 8 to 7, the sale appears in Asha's **My sales** list, and in the evening it is part of the **End of day** report as ₹1,499 in cash.

What the plugin does **not** do:

- It does not create WooCommerce orders. In-store sales are kept in the plugin's own sales record. You see them under **QR & Barcodes**, not under WooCommerce → Orders or Analytics.
- It does not take payments. The seller records how the customer paid (Cash, UPI, Card or Other). The money itself is handled as usual.
- It never shows cost prices, profit or margin to anyone except administrators.
- It does not change how your online shop looks. Customers never see the plugin.

Everything is in the **QR & Barcodes** menu in wp-admin, just below Products. It has five pages: **Dashboard**, **In-store sales**, **In-store reports**, **Bulk tools** and **Settings**.

2. Setting up Administrator only

Do these steps once, in this order.

2.1 WooCommerce stock

WooCommerce must be installed and active. Turn on stock management (WooCommerce → Settings → Products → Inventory → "Enable stock management"), and on each product tick **Track stock quantity for this product** on its Inventory tab. Items without tracked stock can be scanned, but not sold.

2.2 Permalinks

Settings → Permalinks must be anything except "Plain" (for example "Post name"). Every label contains an address ending in `/scan/...`, and that address only works with these "pretty" permalinks. With "Plain", the plugin shows a warning on the Dashboard and an error in the Health check, and every label opens an error page. Changing the permalinks back fixes all labels; nothing needs to be reprinted.

2.3 Settings

Open **QR & Barcodes → Settings**.

Dashboard In-store sales In-store reports Bulk tools **Settings**

Settings

Settings Health check

QR codes and barcodes

QR codes are always generated and are the main way to scan a product with a phone camera. A QR code contains only the scan URL for the product code, never product details.

Enable barcodes (for hardware scanners) ☒ Also produce Code 128 barcodes

Off by default. Turn this on only if staff use hardware barcode scanners. The barcode holds the same product code as the QR code, so no codes need to be regenerated.

Scan base URL

Leave empty to use the site URL. Otherwise enter an absolute `http://` or `https://` address; any trailing slash, query string or fragment is removed. Codes are stored, URLs are not, so changing this never changes any product code.

Effective scan base URL: `https://shop.example.com`

QR codes will contain: `https://shop.example.com/scan/DC-XXXX-XXXX-XXXX/`

In-store sales

Payment methods offered ☒ Cash ☒ UPI ☒ Card ☐ Other

The sale form asks the seller to choose one of these. At least one must stay enabled. Split or mixed payments are not supported: record the sale under the main method.

Save Changes

QR & Barcodes → Settings, with the scan base URL of the sample shop

- **Scan base URL.** Leave it empty to use your site's address, or enter the address that phones should open. Before you print real labels it must be the final, public `https://` address of your shop. The line **QR codes will contain:** shows an example of what goes into every QR code.

- **Enable barcodes (for hardware scanners).** Tick this only if you use a USB or Bluetooth barcode scanner. QR codes work with any phone camera and need nothing extra.
- **Payment methods offered.** Cash, UPI and Card are on by default; Other is available. At least one must stay on. The seller must choose one for every sale.

Important: print real labels only after the shop is on its final https address. A label contains the web address it was printed with. Labels printed while the site is on a test address (such as localhost) or on http:// never work on the live shop and must be reprinted. While the address is local, the Dashboard and the print screen warn you, and test labels are marked "TEST – NOT FOR USE".

Needs attention

- QR codes currently point to a local address (http://localhost/sharayu). Do not print labels until the production URL is set. [Scan base URL settings](#)

The Dashboard's warning while the site still runs on a local test address

2.4 Staff accounts

Create one account for each person (see chapter 3). Then print your first labels (chapter 5).

3. Staff accounts and roles

Give every person their own login. Never share an account. Every sale records who made it, "My sales" shows each seller only their own sales, and a seller can only undo their own sale. A shared login makes all of this meaningless.

To create a seller: **Users** → **Add New**, choose the role **Store Seller**, and give them a strong password. They log in on their own phone the first time they scan a label. Shop managers use the WooCommerce role **Shop manager**.

Who sees and does what:

	Store Seller	Shop manager	Administrator
Scan labels, see product, price and stock	Yes	Yes	Yes
Sell, and undo their own sale within 10 minutes	Yes	Yes	Yes
My sales (their own sales only)	Yes	Yes	Yes
Dashboard, In-store sales, In-store reports	No	Yes	Yes
Void any sale (with a reason)	No	Yes	Yes
Create and replace codes, print labels, Code tools	No	Yes	Yes
Cost prices, profit and margin (anywhere)	No	No	Yes
Import cost prices	No	No	Yes
Settings and Health check	No	No	Yes

A **shop manager** does **not** see any cost price, profit, margin or stock value at cost, the **Profit & margin** report, the **Import cost prices** tool, **Settings** or the **Health check**. Their Dashboard and reports show sales, revenue, stock and sellers only.

A **Store Seller** has no wp-admin menu at all. They only use the scan pages on their phone.

4. Product codes

- A code looks like `DC-7K4M-9P2X-Q8RT`. It is random, so it cannot be guessed, and it is permanent.
- Codes are created automatically when an administrator or a shop manager saves a product. A simple product gets one code. A variable product gets one code per variation (the product itself has none).
- To give codes to many existing products at once, use **Bulk tools** → **Code tools** (section 10.1).
- On the product's edit screen, the **QR & Barcode** box shows the codes, lets you view or download the QR image and print labels.

QR & Barcode

A variable product has no code of its own: each variation has its own code.

[Print all variation labels \(3\)](#)

Variation	SKU	Code	Status	Actions
Size: S #127922	SAMPLE-KURTA-S	DC-H2YY-HKZZ-CPZ4	Active	View QR Download QR (SVG) Print label Regenerate...
Size: M #127923	SAMPLE-KURTA-M	DC-PXSA-WHQY-Z4GP	Active	View QR Download QR (SVG) Print label Regenerate...
Size: L #127924	SAMPLE-KURTA-L	DC-FU9W-M2VV-8M44	Active	View QR Download QR (SVG) Print label Regenerate...

The QR & Barcode box of a variable product: one code per size

Replacing a code (Regenerate...): use this only if a label was copied or damaged in a way you do not trust. The old code stops working at once ("This label is out of date") and is never used again. Every label with the old code must be replaced.

Deleting or trashing a product does not delete its sales. A label of a trashed product shows "This product is in the trash".

5. Printing labels

5.1 Where to start

You can start printing from three places:

- **One product:** on the product's edit screen, **Print label** (for a variable product, **Print all variation labels** or **Print label** on one variation).
- **Several products:** the Products list: tick the products and choose the bulk action **Print QR labels**.
- **Everything that just got a code:** after **Generate missing codes**, Bulk tools shows **Print labels** links (section 10.1).

5.2 The print setup

Print QR labels

3 items ready to print · 21 labels with these options

Layout

☒ A4 · 3 × 7 · 63.5 × 38.1 mm (21 per sheet) — QR code 35.1 mm
☐ A4 · 3 × 8 · 70 × 37 mm (24 per sheet) — QR code 32 mm (edge-to-edge sheet)
☐ A4 · 4 × 10 · 48.5 × 25.4 mm (40 per sheet) — QR code 22.4 mm
☐ A4 · 5 × 13 · 38.1 × 21.2 mm (65 per sheet) — QR code 19.2 mm
☐ Thermal · 50 × 25 mm (one label per page) — QR code 20.5 mm
☐ Thermal · 38 × 25 mm (one label per page) — QR code 19.5 mm
☐ Thermal · 100 × 50 mm (one label per page) — QR code 35.9 mm
☐ Custom layout (mm):

Type Thermal printer resolution

Page width Page height Label width Label height Columns Rows Left margin

Top margin Gap between columns Gap between rows

For a thermal printer only the label width and height are used.

Options

Start at position Label sheets only: skip the labels already used on a partly used sheet (counted row by row from the top left).

Copies per item
☒ One label per unit in stock (items that track their own stock; others get 1 label)
At most 300 labels per print job.

Show on the label
☒ Product name ☒ Variation attributes ☐ SKU ☒ Price ☒ Store name ☒ Code (always printed)
Printed prices go out of date when you change them; the QR always shows the live price.

Printer offset (label sheets only): right mm down mm Moves everything by up to ±5 mm if your printer prints slightly off; negative values move left or up.

Your choices are remembered for next time (for your user only).

The print setup for the three sizes of the sample kurta, with "One label per unit in stock"

- **Layout.** A4 label sheets: 3 × 7 (the default, 21 per sheet), 3 × 8, 4 × 10 or 5 × 13. Thermal label printers: 50 × 25 mm, 38 × 25 mm or 100 × 50 mm. Or a **Custom layout** to match your label stock.
- **Start at position.** To use a partly used sheet, start at label N (counted row by row from the top left).
- **Copies.** A fixed number **per item**, or **One label per unit in stock**.

- **Show on the label:** product name, variation attributes (size, colour...), SKU, price, store name. The code is always printed. A printed price goes out of date when you change the price; the QR code always shows the live price.
- **Printer offset.** If your printer prints slightly off, move everything a few millimetres right or down.

Example: one label per unit in stock. The sample kurta has three sizes. After the day's sales there are 10 in size S, 7 in size M and 4 in size L. With **One label per unit in stock**, the print job has $10 + 7 + 4 = 21$ labels: exactly one A4 sheet of 3×7 . An item whose stock is not tracked, or is shared with its parent product, gets 1 label (the screen says so), and an item with 0 in stock gets none. With **1 per item** instead, you would get 3 labels.

5.3 Preview and print

Press **Preview and print**. The next page shows the labels as they will print.

Print QR labels

21 labels · A4 · 3×7 · 63.5×38.1 mm (21 per sheet) · 1 pages · QR code 35.1 mm (0.856 mm per module)

[Print](#)
[Change options](#)
[Back to products](#)

In the print dialog:

- Scale: 100% ("Default" in Chrome and Edge; "Actual size" in other dialogs). Never "Fit to page".
- Margins: None.
- Headers and footers: off.
- Paper: 210×297 mm, portrait. Print one page on plain paper first and hold it against a label sheet to check the alignment.
- Background graphics are not needed: labels are printed in black on white.

The label preview (sample shop, sample address)

In the browser's print dialog set: scale **100%** ("Default" or "Actual size", never "Fit to page"), margins **None**, and headers and footers **off**. For a thermal printer, also set the label size in the printer's own settings.

The plugin never prints a QR code too small to scan. If a layout is too small for the QR code, it says how much room it needs instead of shrinking it. A print job has at most 300 labels.

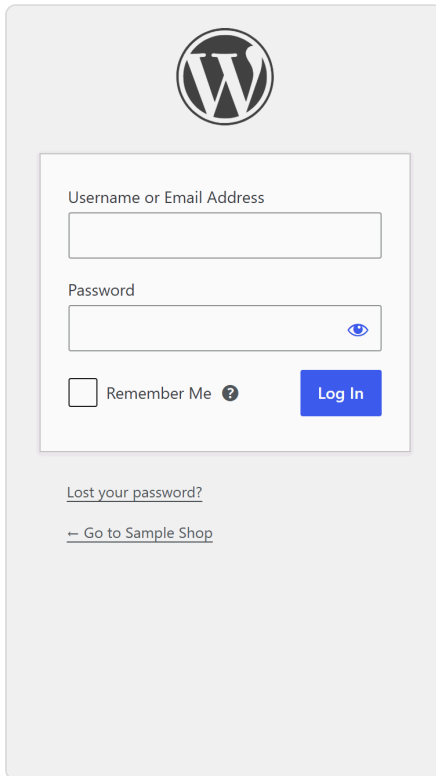

Before your first real labels: print one sheet on plain paper, hold it against the label stock to check the alignment, and scan several labels with a phone. Without a printer you can still check: choose "Save as PDF" in the print dialog, open the PDF on a computer screen and scan the codes from the screen with a phone.

6. Selling on the phone

This chapter is for everyone who sells: Store Sellers, shop managers and administrators. The one-page **seller guide** has the same steps with pictures; open it from the Dashboard or from the link at the bottom of **My sales**.

6.1 Log in and scan

Scan the item's label with the phone camera and open the link. The first time, the phone asks you to log in: use **your own** username and password. After that the phone remembers you.

Username or Email Address

Password

☐ Remember Me [?](#) [Log In](#)

[Lost your password?](#)

[← Go to Sample Shop](#)

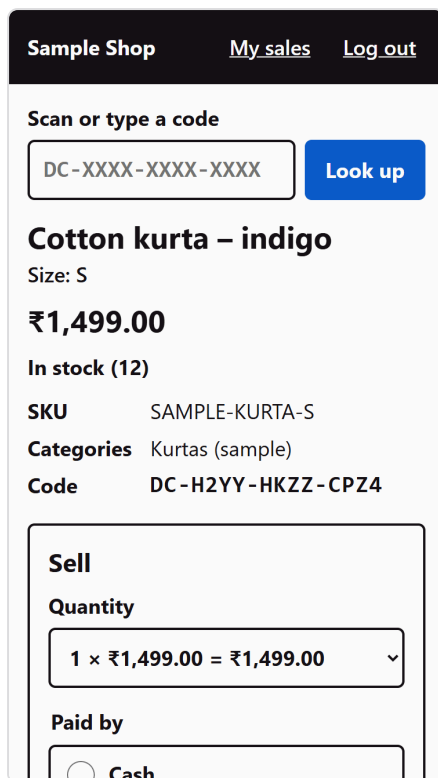

The login page on a phone

6.2 Check the product

The scan page shows the product, the variation (for example the size), the price and the stock. **Check that it is the item in your hand.** If the label does not scan, type the code printed under the QR code into **Scan or type a code** and press **Look up**.

6.3 Quantity and payment method

Choose the **Quantity** and how the customer paid under **Paid by** (Cash, UPI, Card or Other: whatever the shop offers). The payment method is required. Then press **Confirm sale**.

6.4 Sold, and Undo

The next screen says **Sold**, with the quantity, the total, the payment method and the stock left. Press **Scan next item** for the next sale.

Made a mistake? Press **Undo this sale**. The sale is cancelled and the stock goes back. Undo is available for **10 minutes**; after that the button disappears by itself and only a manager can void the sale (chapter 7).

6.5 My sales

My sales (at the top of the scan page) lists your own sales for **Today**, **Yesterday** or the **Last 7 days**, with a summary per payment method. The link **How to sell (guide)** at the bottom opens the seller guide.

[How to sell \(guide\)](#)

My sales: Asha's sales today

6.6 When a sale is refused

A sale is refused, and nothing changes, when the item is out of stock, has no price, is not published, or when its price changed since the page was opened. The screen says why. "This item just sold online" means the last one went to an online order at the same moment. Pressing **Confirm sale** twice, or a poor connection, never sells twice.

Void sale #132?

Printed cotton scarf · 2 × ₹349.00 = ₹698.00 · Card · Asha

Reason (required)

☒ Return 2 to stock (stock now 18)

The sale stays in the history, marked as voided, with your name, the time and the reason. It no longer counts in totals.

Void sale
Cancel

Voiding a sale: the reason is required

To change the payment method of a sale: void it (with the reason "wrong payment method") and sell the item again with the right method.

8. End of day and cash in the drawer

At closing time open **QR & Barcodes** → **In-store reports** → **End of day** (or **End of day** on the Dashboard). It shows, for the day:

- sales and revenue per payment method (Cash, UPI, Card, Other),
- sales voided today, and refunds of sales from earlier days,
- each seller's figures,
- **Cash expected in drawer:** today's cash sales, minus the cash of earlier days' sales that were voided (refunded) today. A sale made and voided on the same day is simply not counted.

In-store (scan) sales only — online orders are in WooCommerce → Analytics. Revenue, items and sales count completed sales only; voided and failed sales are not in revenue. Amounts are as recorded at the moment of sale. A "sale" is one scanned item with its quantity. Days are in the site timezone (Asia/Kolkata).

Today | Yesterday

From 29-09-2026 To 29-09-2026 Apply

Tue 29 Sep 2026

End of day — Tue 29 Sep 2026

Cash expected in drawer
₹3,398.00
₹4,297.00 sales – ₹899.00 refunds of earlier sales

UPI net collected
₹6,297.00

Card net collected
₹698.00

Other net collected
₹0.00

Net collected = revenue of this period's completed sales – the amounts of EARLIER sales voided in this period, per payment method. Assumption: refunds are paid back in the original payment method. A sale made and voided in the same period is already not in revenue, so it is not subtracted again.

By payment method

Paid by	Sales	Items	Revenue	Refunds of earlier sales	Net collected
Cash	3	3	₹4,297.00	₹899.00	₹3,398.00
UPI	2	3	₹6,297.00	₹0.00	₹6,297.00
Card	1	2	₹698.00	₹0.00	₹698.00
Other	0	0	₹0.00	₹0.00	₹0.00
Total	6	8	₹11,292.00	₹899.00	₹10,393.00

By seller (who sold) — net collected

Seller	Cash	UPI	Card	Other	Total
Asha	₹1,899.00 (₹2,798.00 – ₹899.00)	₹2,998.00	₹698.00	₹0.00	₹5,595.00
Vikram	₹1,499.00	₹3,299.00	₹0.00	₹0.00	₹4,798.00

Each sale belongs to the seller who sold it; a refund of an earlier sale is taken from that seller's figure. Who paid the refund out is listed below.

Refunds of earlier sales

- Voided in this period by Ravi (sample): Cash ₹899.00 (1 sale)

Voided sales made in this period (not in revenue)

None.

Voided in this period, sold earlier (the refunds above)

Sale #	Sold	Item	Total	Paid by	Sold by	Voided	Voided by	Reason	Returned to stock
#127	September 28, 2026 5:40 pm	Silk dupatta – maroon	₹899.00	Cash	Asha	September 29, 2026 4:41 pm	Ravi (sample)	Customer returned it (unused).	Yes

End of day for the sample shop

Example. Today the sample shop sold two kurtas at ₹1,499 and a linen shirt at ₹1,299, all paid in cash: ₹4,297. A customer also returned a silk dupatta bought yesterday for ₹899 in cash, and Ravi voided that sale today and gave the money back. **Cash expected in drawer = ₹4,297 – ₹899 = ₹3,398.** Count the drawer and compare. UPI and card sales are listed too, but they are not cash in the drawer.

Use **Print** for a paper copy, or **Export CSV**. If the cash does not match, open **In-store sales** for today, filtered by **Paid by: Cash**, and check the voids.

9. Reports

QR & Barcodes → In-store reports (shop managers and administrators). Choose a period: Today, Yesterday, Last 7 days, This week, This month, Last month, Last 12 months, or your own dates. Each report compares with the previous period up to the same point in time ("Compared with ...").

DashboardIn-store salesIn-store reportsBulk toolsSettings

In-store reports

SummarySales over timeProductsCategoriesSellersPeak timesEnd of dayProfit & marginVoids & failedStockDead stock

In-store (scan) sales only — online orders are in WooCommerce → Analytics. Revenue, items and sales count completed sales only; voided and failed sales are not in revenue. Amounts are as recorded at the moment of sale. A "sale" is one scanned item with its quantity. Days are in the site timezone (Asia/Kolkata). Profit = total – quantity × unit cost, for sales whose cost was known at the moment of sale. Sales with an unknown cost are left out of cost, profit and margin (never counted as zero) and are shown separately. Margin = profit ÷ revenue of the sales with a known cost.

Today | This week | This month

4. Cotton kurta – indigo – Size: M — ₹1,499.00 (1 items)
5. Linen shirt – white — ₹1,299.00 (1 items)

In-store reports → Summary for the last 7 days

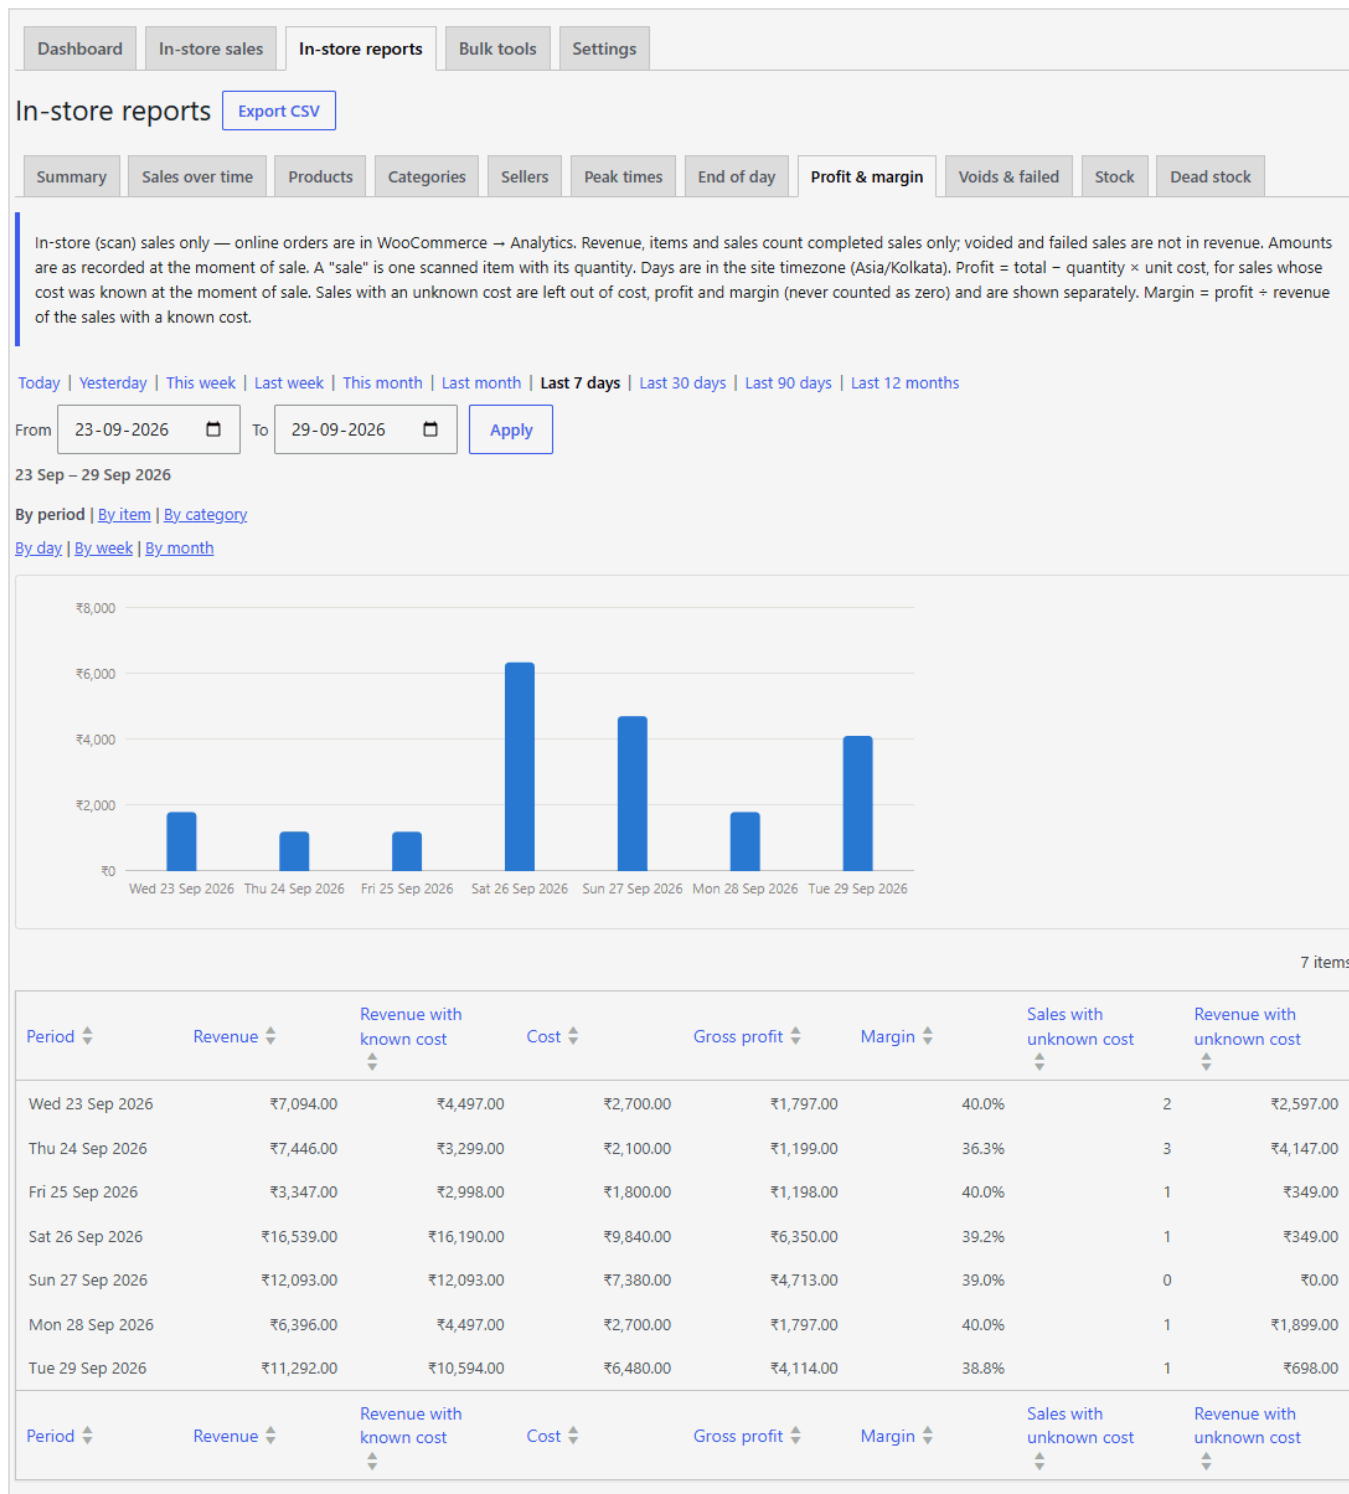

- **Summary:** revenue, sales, items, average sale, the split by payment method, and alerts (low stock, out of stock, voids, items without a code).

- **Sales over time, Products** (best and slow sellers), **Categories, Sellers, Peak times** (the busiest hours and days).
- **End of day** (chapter 8) and **Voids & failed**.
- **Stock** (with low stock and the value of the stock), **Dead stock** (items in stock with no sale for 30, 60 or 90 days, counting online orders too).
- **Profit & margin** (administrators only; see below).

Rules used everywhere: revenue counts completed sales only; days follow the shop's timezone; amounts are as recorded at the moment of sale. Every report has **Export CSV**, and several have **Print**.

9.1 Profit & margin Administrator only

Profit is counted only where the cost price is known. The report says how many sales had no cost price, and leaves them out of profit and margin. Each sale keeps the cost price it had at the moment of sale, so changing a cost later does not change past profit.

Profit & margin for the last 7 days (administrators only)

Cost prices are optional. Enter them on the product's edit screen (**Cost price** (₹) under the price; for a variable product a default cost price plus, if needed, one per variation), or many at once with **Import cost prices** (section 10.3). A missing cost is "unknown", never zero.

10. Bulk tools

QR & Barcodes → Bulk tools has two tabs: **Code tools** (shop managers and administrators) and **Import cost prices** (administrators only). Every bulk action is recorded in **Recent bulk runs** (section 10.4).

10.1 Generate missing codes

Worked example: a catalogue of 200 T-shirts. The sample shop imported 200 new T-shirts. Imported products have no codes yet, because codes are only created automatically when someone saves a product in wp-admin. **Code tools** shows how many items need one.

Generate missing codes
Gives a product code to every simple product and every variation that does not have one yet, using the same rules as saving a product: variable products themselves never get a code (their variations do), and items in the trash never do. Existing codes are never changed. Codes are permanent; they are never deleted, so check the count first.

Product status	Simple products	Variations	Without a code
☒ Published	200	0	200
☒ Private	0	0	0
☒ Draft	0	0	0
☒ Pending review	0	0	0
☒ Scheduled	0	0	0
Total	200	0	200

A variation counts under its product's status; enabled and disabled variations are both included. Stock tracking does not matter. The Dashboard and In-store reports → Summary count published products only ("Published products without a code").

☐ I understand that up to 200 new codes will be created for the ticked statuses, and that codes are permanent.

Generate missing codes

Code tools: 200 published simple products without a code

1. Check the numbers under **Without a code**. Tick the product statuses to include (normally only **Published**).
2. Tick **I understand that up to 200 new codes will be created for the ticked statuses, and that codes are permanent**.
3. Press **Generate missing codes**. The codes are created in batches of 100 while the page shows the progress (**100 of about 200 items**). Keep the page open; it continues by itself.

Stop and continue. You can press **Stop** at any time, for example to close the shop's computer. The codes already created stay. Code tools then shows **Stopped** with the counts so far, and the Dashboard reminds you: "Code generation was stopped before it finished." Press **Continue** (in Code tools, or **Continue in Bulk tools** on the Dashboard) to carry on where it stopped. If the page was simply closed, the run shows as **Interrupted** after a few minutes and can be continued the same way.

Generate missing codes

Gives a product code to every simple product and every variation that does not have one yet, using the same rules as saving a product: variable products themselves never get a code (their variations do), and items in the trash never do. Existing codes are never changed. Codes are permanent: they are never deleted, so check the count first.

Stopped

100 of about 200 items

- Codes created: 100
- Already had a code by then: 0
- Skipped (changed or trashed during the run): 0
- Failed: 0

Started by Owner (sample) on 2026-09-29 16:43; product statuses: Published.

Continue

Dismiss

A run stopped after the first 100 codes

When the run is **Finished**, the summary shows **Codes created: 200** and links **Print labels for the codes just created**. Each link opens the label print setup for up to 300 items, so 200 T-shirts need one link: **Print labels: items 1–200**. Then continue as in chapter 5 (for example with **One label per unit in stock**).

Generate missing codes

Gives a product code to every simple product and every variation that does not have one yet, using the same rules as saving a product: variable products themselves never get a code (their variations do), and items in the trash never do. Existing codes are never changed. Codes are permanent: they are never deleted, so check the count first.

Finished

200 of about 200 items

- Codes created: 200
- Already had a code by then: 0
- Skipped (changed or trashed during the run): 0
- Failed: 0

Started by Owner (sample) on 2026-09-29 16:43; product statuses: Published.

Clear this summary

Print labels for the codes just created

Opens the label print setup (at most 300 items per print job).

Print labels: items 1–200

Every qualifying product and variation has a code.

Finished: 200 codes created, with the link to print their labels

Codes are permanent: they are never deleted, so check the count before you start. Existing codes are never changed. Variable products themselves never get a code (their variations do), and items in the trash never do.

Why can the Dashboard's number be lower? The Dashboard counts only **published** items without a code (what can be sold now); Code tools also counts drafts, private, pending and scheduled items.

10.2 Export codes CSV

Export codes (CSV) downloads every code with its product, variation, SKU, product status, code status and scan URL. Choose **Active codes**, **Retired codes** or both, and tick **Also list products and variations without a code** to find the gaps. Then press **Download CSV**.

Export codes (CSV)

Codes: Active codes Product status: Any Type: Any

☐ Also list products and variations without a code (at the end, with an empty code)

[Download CSV](#)

Columns: item ID, parent ID, type, SKU, product, attributes, product status, code, code status, scan URL (active codes only), created and retired dates. It never contains cost data. SKUs are exact in the file; Excel removes leading zeros ("00123") when a CSV is opened by double-click: use Data → From Text/CSV and set the SKU column to Text.

Export codes (CSV)

The file never contains cost prices. To open it in Excel with SKUs such as "00123" intact, use **Data → From Text/CSV** and set the SKU column to Text.

10.3 Import cost prices Administrator only

Worked example. The owner wants to enter the cost prices of two new products, remove a wrong cost price, and (by mistake) types a letter O instead of a zero in one cost.

Step 1 – the template. On the **Import cost prices** tab, press **Download the template (all products with their current cost prices)**. It is a CSV file with one row per product and variation: ID, parent ID, type, SKU, product, attributes and **Cost price (₹)**.

Step 2 – fill in the costs. Open the file in Excel and change only the **Cost price** column. You can delete the rows you do not change. In the example:

- Printed cotton scarf: **180** (₹180)
- Wool shawl – grey: **1,200.50** (commas and decimals are fine)
- Silk dupatta – maroon: **clear** (removes the cost price; it becomes "unknown")
- Linen shirt – white: **78O** (a typing mistake: the letter O)
- Handloom saree – green: left **empty** (an empty cell changes nothing)

sample-costs.csv

	A	B	C	D	E	F	G
1	Item ID	Parent ID	Type	SKU	Product	Attributes	Cost price (₹)
2	127926	0	simple	SAMPLE-SCARF	Printed cotton scarf		180
3	127929	0	simple	SAMPLE-SHAWL	Wool shawl – grey		1,200.50
4	127925	0	simple	SAMPLE-DUPATTA	Silk dupatta – maroon		clear
5	127928	0	simple	SAMPLE-SHIRT	Linen shirt – white		78O
6	127927	0	simple	SAMPLE-SAREE	Handloom saree – green		

The filled-in file, as it looks in a spreadsheet

Numbers such as 1200.50, 1,200.50, 1,20,000, ₹1200, Rs. 1200 or 1200/- are all accepted. 0 means a known cost of zero. Save the file from Excel as **CSV UTF-8 (Comma delimited)**.

Step 3 – upload and preview. Choose the file under **CSV file** and press **Upload and preview**. Nothing is saved yet. The preview counts each outcome (**Update**, **Clear (becomes unknown)**, **No change**, **Error**) and lists the rows, errors first, with the reason.

Dashboard
In-store sales
In-store reports
Bulk tools
Settings

Bulk tools

Code tools
Import cost prices

Import cost prices

Only administrators see this. Upload a CSV file with an ID or SKU column and a "Cost price" column. You see a preview first; nothing changes until you apply it.

Download the template (all products with their current cost prices)

- Rows are matched by ID; the SKU is used when the ID is empty. A variable product's row sets the default cost price for its variations.
- An empty cost cell changes nothing. Write "clear" to remove a cost price (it becomes unknown). 0 is a known cost of zero.
- Numbers like 1200.50, 1,200.50, 1,20,000, ₹1200, Rs. 1200 or 1200/- are accepted, with at most 2 decimals (never rounded).
- At most 1 MB and 5,000 rows per file. Save from Excel as "CSV UTF-8 (Comma delimited)".

sample-costs.csv: 5 rows

- Update: 2
- Clear (becomes unknown): 1
- No change (same value): 0
- No change (empty cell): 1
- Error: 1

Download the full report (CSV)

☐ Apply the 3 valid changes and skip the 1 rows with errors.

Apply 3 changes

Cancel and upload another file

Line	Item ID	SKU	Product	Cost now	New cost	Outcome	Reason
5	127928	SAMPLE-SHIRT	Linen shirt – white			Error	Not a number. Use e.g. 1200.50, 1,200.50, 1,20,000 or ₹1200. Leave the cell empty for no change, or write "clear" to remove the cost price.
2	127926	SAMPLE-SCARF	Printed cotton scarf	unknown	180.00	Update	
3	127929	SAMPLE-SHAWL	Wool shawl – grey	unknown	1200.50	Update	
4	127925	SAMPLE-DUPATTA	Silk dupatta – maroon	520.00	unknown	Clear (becomes unknown)	
6	127927	SAMPLE-SAREE	Handloom saree – green	2100.00		No change (empty cell)	

The preview: 2 updates, 1 clear, 1 empty cell and 1 error row with its reason

In the example the shirt's row says **Error**: "Not a number. Use e.g. 1200.50, 1,200.50, 1,20,000 or ₹1200...". You can correct the file and upload it again (**Cancel and upload another file**), or apply the valid rows now and fix the shirt later.

Step 4 – apply. Tick **Apply the 3 valid changes and skip the 1 rows with errors** (shown only when there are errors) and press **Apply 3 changes**. The prices are saved in batches.

Step 5 – the report. When it is done, the page shows **Applied** with the counts. **Download the full report (CSV)** gives every row with the old and new cost; it stays available for an hour, so keep it if you need a record.

Download the full report (CSV)

Applied

The import report: 3 cost prices applied

If someone changed a cost on the product screen between your preview and your apply, that row is skipped ("Skipped: the cost was changed after the preview") so nothing is overwritten by mistake.

10.4 Recent bulk runs

The **Code tools** tab ends with **Recent bulk runs**: when, which tool and who, for code generation, code exports and cost imports. Only the counts are kept, never the prices. Shop managers do not see cost-import entries at all. The Dashboard shows the latest runs too.

Recent bulk runs			
When	User	Tool	Details
2026-09-29 16:43:32	Owner (sample)	Cost price import	outcome: applied; file: sample-costs.csv; sha256: 25b9c0cb57a0986e6eafbaa512984cd078861c267b4d0e16d47ef903acdb3c80; rows: 5; changed: 3; already: 0; skipped_stale: 0; failed: 0; errors_skipped: 1; no_change: 1

The Dashboard for a shop manager

If the Dashboard says it has become slow on real data (it only says so when it happens repeatedly), tell the person who looks after the website: there is a planned improvement for that case.

12. Health check Administrator only

QR & Barcodes → Settings → Health check looks for problems in the stored data and explains each one. It only reads; it never changes anything.

DashboardIn-store salesIn-store reportsBulk toolsSettings

SettingsHealth check

Read-only checks of the plugin's data. Nothing on this page changes anything.

No problems found.

Database tables
Error: none found.
The plugin's tables exist and their version matches the plugin.

Scan links (permalinks)
Error: none found.
Printed labels open addresses such as `https://shop.example.com/scan/DC-XXXX-XXXX-XXXX/`. They work only with a permalink structure other than "Plain" and without `index.php`; otherwise every label opens an error page. Choose another structure under Settings → Permalinks (the labels need no reprint).

Negative stock
Error: none found.
Items with a product code (or the parent product that holds their stock) with stock below zero. Count the item and correct its stock on the product screen.

Sales without a stock snapshot
Warning: none found.
Completed sales whose "stock after" was not recorded because the request stopped right after changing the stock. The stock and the sale agree; only the snapshot is missing. Nothing to repair.

Interrupted sales
Warning: none found.
Sales still "in progress" after 15 minutes: the request stopped before changing the stock, so no stock changed. The next sale of the same item marks them failed automatically.

Codes on missing or unsuitable items
Error: none found.
Active product codes whose item was deleted or can no longer have a code. Check the product; printed labels with these codes will not sell.

One active code per item
Error: none found.
Every item has at most one active code, and every code row is consistent. This should never find anything; if it does, keep a database backup and investigate before changing anything.

The Health check of the sample shop: no problems found

Finding	What to do
Database tables	Deactivate and reactivate the plugin.
Scan links (permalinks)	Choose any permalink setting except "Plain". Labels need no reprint.
Negative stock	Count the item and correct the stock on the product screen.
Sales without a stock snapshot	Nothing; stock and sale agree.
Interrupted sales	Nothing; they are closed automatically by the next sale of the item.
Codes on missing or unsuitable items	Check the product; these labels cannot sell.

Finding	What to do
One active code per item	Should never happen. Keep a backup and ask for help before changing anything.
Cost prices	Re-enter the cost on the product or with Import cost prices.
Codes on trashed items, Sales of deleted items	Information only.

When the Health check finds errors or warnings, the Dashboard shows administrators "The health check found N problems in the plugin's data" with a link.

13. Backups, updates and removing the plugin

- **Backups.** Your web host should back up the database every day. The plugin's codes and sales are in the database, in tables ending in `pqbg_codes` and `pqbg_sales`. Make an extra backup before a bulk action on the whole catalogue and before every update.
- **Updates.** Install a new version by uploading its zip file (**Plugins → Add New → Upload Plugin**; WordPress offers to replace the current version). Your codes, sales and settings stay.
- **Deactivating** the plugin stops scanning and selling (labels show an error page) but keeps all data. Reactivating brings everything back.
- **Deleting** the plugin from the Plugins screen also keeps your codes, sales, settings and the Store Seller role. This is on purpose: printed labels and your sales record survive an accidental delete, and reinstalling picks everything up again.
- **To remove everything permanently** (only if you will never use the labels or the sales record again): make a backup, ask the person who looks after the website to add `define('PQBG_UNINSTALL_DELETE_ALL_DATA', true );` to `wp-config.php`, then delete the plugin. This cannot be undone.

14. Common problems

What you see	Why, and what to do
A scanned label opens an error or "page not found" page	Permalinks are "Plain", or the label was printed with another address. Check Settings → Permalinks and QR & Barcodes → Settings → Scan base URL.
"This label is out of date"	The code was replaced. Print a new label from the product.
"This product is in the trash" / "Not published – cannot be sold yet"	Restore or publish the product.
The item cannot be sold because stock is not tracked	On the product's Inventory tab, tick "Track stock quantity for this product".
"Out of stock – cannot be sold."	Check the item and correct its stock on the product screen if it is wrong.
The item has no price	Set a price on the product.
A seller sees "You do not have permission"	Their account needs the Store Seller role (or Shop manager).
A seller cannot log in on the phone	Reset their password under Users. Never give them another person's login.
"Someone else is selling this item right now"	Two people pressed Confirm sale for the same item at the same moment. Wait two seconds and try again.
A label does not scan	Check the print scale was 100% and the label is clean; hold the phone closer or further. Reprint from the product.
Labels were printed with a local or http:// address	They will never work on the live shop. Set the Scan base URL (section 2.3) and reprint them.
Cash in the drawer does not match End of day	Check In-store sales for today filtered by Cash, and the voids.
The Plugin guide button opens nothing	The browser blocked the new tab: allow pop-ups for your site, or right-click the button and choose "Open link in new tab".
The manual downloads instead of opening	Some phones and browsers save PDF files instead of showing them. Open the downloaded file.

For anything else, the technical details are in `README.md` in the plugin folder.
